

Kaplan-Meier Survival Curves (High vs Low Risk)

Feature Coefficients from LASSO Cox Model

Features

Conclusions:

1. The best alpha chosen by cross-validation is 0.0010.
2. The cross-validated c-index was 0.608, indicating above chance performance model discriminative ability.
3. Patients stratified by median predicted risk scores show distinct survival curves, with the high-risk group demonstrating worse survival.
4. Statistical test results comparing survival curves:
 - Log-Rank Test p-value: 0.0000, Test-statistics: 25.9450
 - Breslow Test p-value: 0.0000, Test-statistics: 4077207.5729
 - Tarone-Ware Test p-value: 0.0000, Test-statistics: 184746.5402
 - Wilcoxon Test p-value: 0.0000, Test-statistics: 4077207.5729
5. The LASSO penalty shrinks some coefficients to zero, highlighting the most informative features.
